

Marine Mammals – Dall's Porpoise Distribution

description

The Dall's porpoise (Phocoenoides dalli), named after American naturalist W.H. Dall, is likely the fastest swimming cetacean in British Columbia, reaching speeds of up to 55 kilometres per hour. This black and white porpoise is relatively common in British Columbia waters and is only found in the north Pacific, ranging from California to Alaska and across the ocean to Japan.

Data illustrated are modelled values representing the distribution of Dall's porpoise in terms of relative densities. These density estimates are based upon porpoise observations recorded during systematic surveys in the summers of 2004, 2005 and 2006, and environmental parameters including latitude, longitude, and depth. Survey results and modelling work has been peer reviewed (Williams and O'Hara, 2010; Williams and Thomas, 2007). Distribution illustrated here is restricted to the extents surveyed (Figure 1).

Data were received in 2010 as points with values and coordinates. The points were plotted and converted to a comprehensive 2 nautical mile by 2 nautical mile grid. Density values were classified for illustration into 8 classes based on Jenks natural breaks classification.

The Jenks' natural breaks classification scheme (automated in ESRI ArcGIS software) (Jenks, 1977 and Fisher, 1958) determines the best arrangement of values into classes by iteratively comparing sums of the squared difference between observed values within each class and class means. The "best" classification identifies breaks in the ordered distribution of values that minimizes within-class sum of squared differences, and thus identifies classes that are most homogenous within.

Estimated density values range from zero to two porpoises per square kilometre and the vast majority of density values are at the low end of the range.

reviewer comments

• It is doubtful that any of the inlets have high density, especially those that are miles from the ocean. Dall's porpoise are mostly an southern waters of Vancouver Island, near Victoria. Displayed densities seem low for hotspots.

caveats of use

- Modelled distribution is for the area covered by systematic surveys, and during the temporal extent of the surveys (Figure 1). marine mammals.
- Vancouver Aquarium. See: www.vanaqua.org/conservationinaction/killerwhales/network.htm
- Survey data for two additional years may be available from Raincoast Conservation. Recommend compiling all years of data. See: www.raincoast.org/files/WAS_report/whats_at_stake_ver1.pdf
- Recommended date of expiry for use of these data in a marine planning context: None provided.
